## How Energy Efficient Is Your Home? <br> Worksheet

You can easily determine the relative energy efficiency of your home just by knowing the square footage of your home and how much fuel you consumed last year. Complete the steps below to figure out how energy efficient your home is.

## Step 1 - Determine how much fuel you use.

Determine how much fuel you used last year from all sources, such as oil, wood, propane, etc. You can look at your old bills or call your fuel dealer for this information.

## Step 2 - Convert "fuels used" to BTU equivalents.

(BTUs or British Thermal Units are a standard unit of measurement for heat content in fuels and will give you a common denominator for measuring your fuel usage.)
Multiple the quantity of each fuel you use (Step 1 above) times its BTU equivalent (in chart below) to get total BTUs for each fuel used. If you use more than one kind of fuel, add the BTU amounts together to determine the total amount of BTU used in your home. Use the chart below to convert your fuel use to BTUs.

Converting Fuel Use to BTUs

| Fuel Type | $\begin{array}{c}\text { Number of BTUs } \\ \text { (A) }\end{array}$ |  | $\begin{array}{c}\text { Amount of Fuel Used } \\ \text { (B) }\end{array}$ |
| :--- | :--- | :--- | :--- |
| Oil | $138,200 \mathrm{BTUs} /$ gallon |  | $\begin{array}{c}\text { Total BTUs by Fuel } \\ \text { Used (A) x (B) }\end{array}$ |
| Kerosene | $136,600 \mathrm{BTUs} /$ gallon |  |  |$]$

## Step 3 - Determine the square footage of livable space.

Multiply the width of your house times the depth of your house times the number of floors of livable, heated space. (Basements do not usually count unless they are a heated part of your living space. Include rooms that are not being heated but are in the livable area.)

## Step 4 - Calculate number of BTUs per square foot.

Divide the total BTU used (Step 2) by the total amount of square feet of heated, livable space (Step 3). Total BTUs (Step 2) $\qquad$ $\div$ total square footage (Step 3) $\qquad$ $=$ $\qquad$ BTUs/sq. ft.

## Step 5. Compare your BTU/square foot to an energy efficient home.

If your home uses less than 40,000 BTUs of energy per square foot per year, you have a relatively energy efficient space. If you use over 40,000 BTUs per square foot, you probably have opportunities to improve your heating efficiency, such as improving the efficiency of the building shell (insulation and plugging leaks) and/or improving the efficiency of the heating system. If so, as a next step, consider getting an Energy Audit from a certified Home Performance with ENERGY STAR contractor. For additional ways to reduce your energy use, visit www.efficiencyvermont.com or call 888-921-5990.

## Example for Calculating the Relative Energy Efficiency of Your House

## Assumptions:

Size of house: 1,600 square feet
Amount of fuel used: Two cords of wood and 422 gallons of oil

## Calculations:

Step 1. Two cords of wood x 22,000,000 BTUs $=44,000,000$ BTUs
Step 2. 422 gallons of oil x 138,200 BTUs $=58,320,400$ BTUs
Step 3. 44,000,000 BTUs (wood) $+58,320,400$ BTUs (oil) $=102,330,400$ BTUs total
Step 4. 102,330,400 BTUs $\div 1,600$ square feet of livable (heated) space $=63,950 \mathrm{BTUs} / \mathrm{sq}$. ft .
This house is relatively inefficient and has relatively good opportunities for improving efficiency.
These worksheets are adapted from materials developed by Sustainable Energy Resource Group, Thetford, Vermont. You can find an on-line automatic calculator to run the numbers for your home at their website: web.valley.net/serg/energy-assessment. The calculator is under "Step 1."
